# Content

- Industry problem
  - General
  - Interview results
  - Specific to robotic factory
- Available system solutions
  - System for collaboration support
- Solution
  - Description
  - Results (800xA integrations, visualization)

# Industry Challenges

Industry 3.0

# People, Systems and Equipment Collaboration

 **Industry 4.0**

# Questionnaire to measure digital maturity

**System  
to  
System**

Questions about how well systems are connected /integrated.

**Equipment  
to  
Equipment**

Questions about how well equipment is connected other equipment

**System  
to  
Equipment**

Questions about how well systems are connected/integrated to the equipment

**Equipment  
to  
People**

Questions about how well equipment are collaborating with people

**System  
to  
People**

Questions about how well systems collaborate with people

**People  
to  
People**

Questions about how well people collaborate with other people

# Plot of Digital maturity

Each question can be answered with a rating from 1 - 4

1 = not implemented

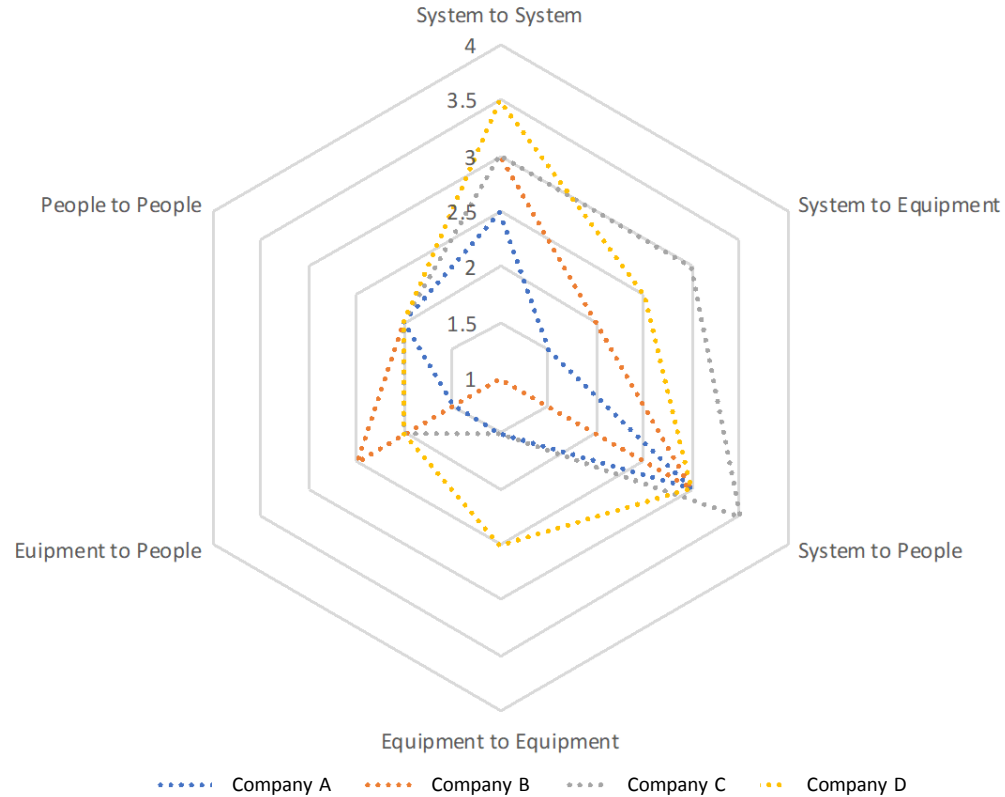

4 = fully implemented

The average in each dimension leads to a diagram to visualize the results.

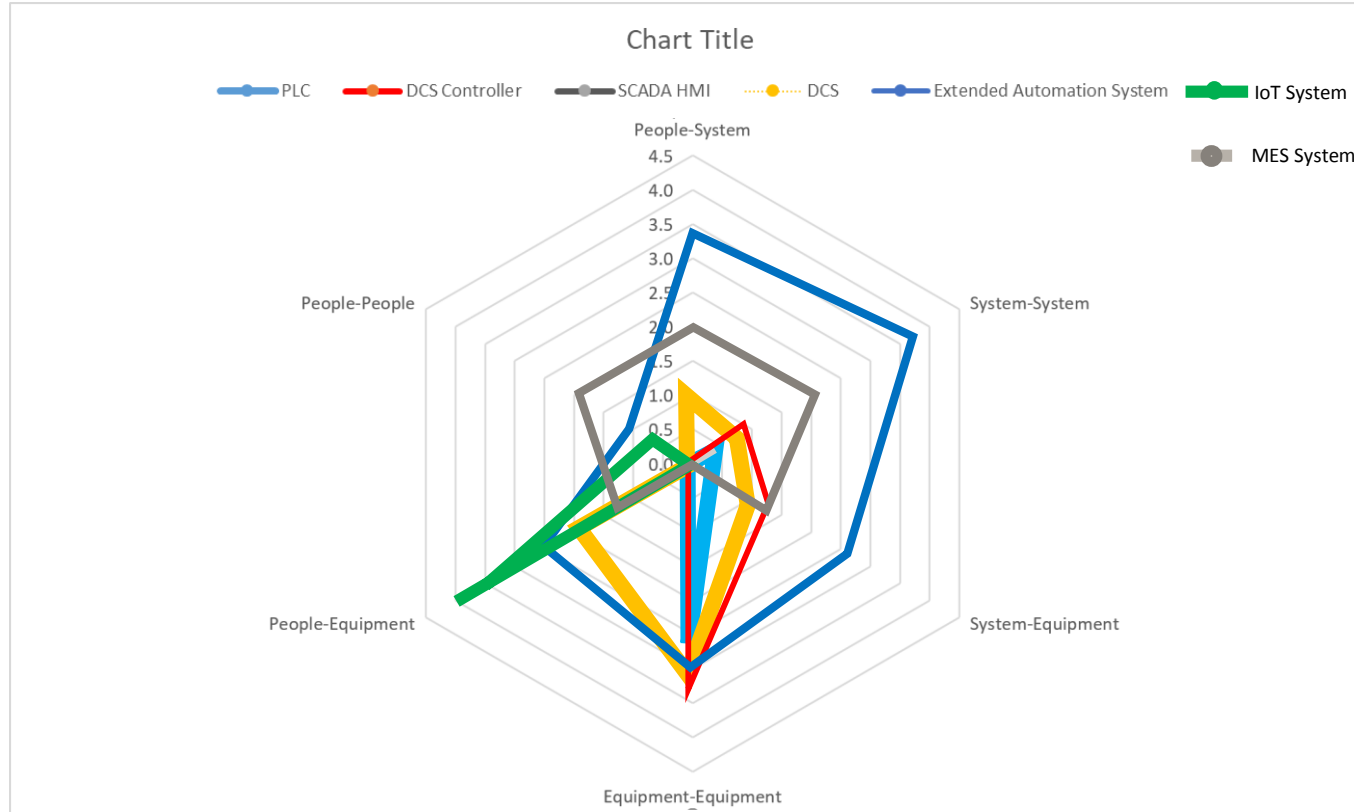

Note: For the background interviews the interviewer made the rating based on the answers received. Within the report the information gained from the interviews were summarised according the dimensions to fulfil the need to gain background knowledge and identify potential use-cases.

# Comparison -> Digital Collaboration Profiles

# Collaboration values of Automation Systems

PLC: Programmable Logic Controller

DCS: Distributed Control System

SCADA: Supervisory Control And Data Acquisition

IoT: Internet of Things

MES: Manufacturing Execution System

# PADME – Test Bed

## Objectives - Test Bed for the Smart Digital Factory

- Arena
  - The Production Line for the assembly of medium and large size Robots at ABB Robotics in Västerås
- Target
  - Decrease throughput times by 50% and level production through increased automation and digitalization
- Technical Solution
  - Create a digital twin of the processes (model the factory in 800xA system) with real-time information from the process
  - Implement applications to optimize operations

# ABB Robotics - Manufacturing of a Robot

Discrete manufacturing comprises of separate production units where each unit delivers part of the final product

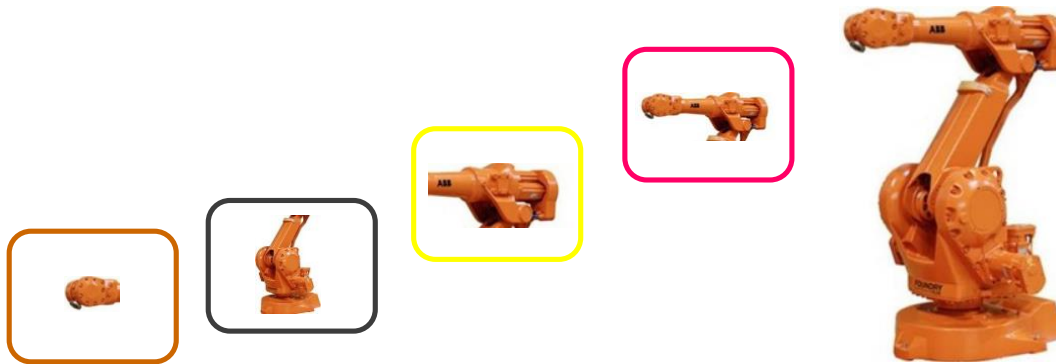

The manufacturing process is often divided in smaller steps called sequences

Each production unit is often a combination of manual and automatic sequences

Each production unit follows a production recipe, which is a set of sequences in a specific order mandated by design

Process controller within production unit:

- Often a controller exists within a production unit to control the execution of sequences
- There may exist production units that are fully manual and there is no controller within those sections

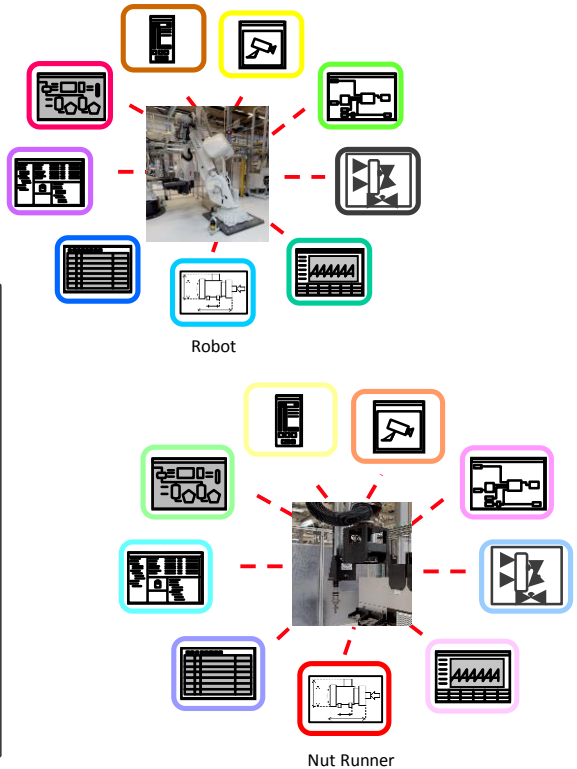

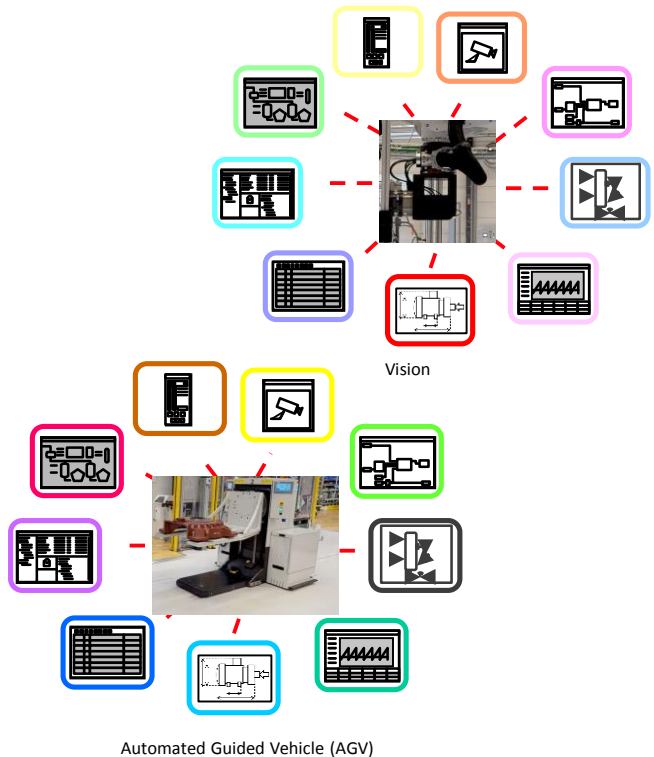

# PADME

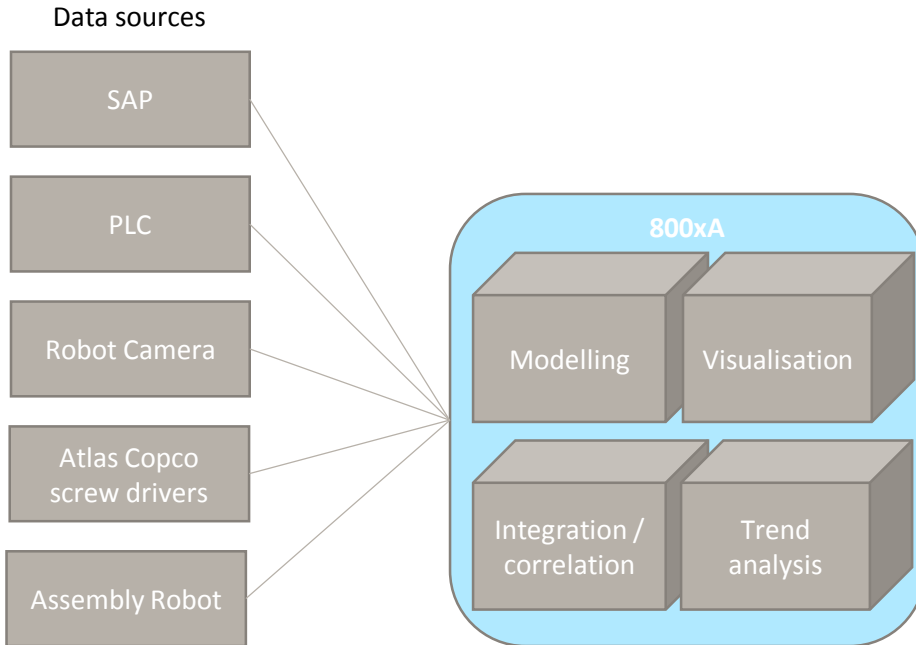

## 60+ collaborating systems

- 6st IRB
- 22st Säkerhetscannrar
- 9st Ljusbommar
- 8st AGVer
- 1st AGV-controller
- 1st Huvud-PLC
- 1st säkerhets-PLC
- 2st åkbanor
- 5st lättbanessystem
- 4st bitsväxlare
- 8st Elektriska dragare

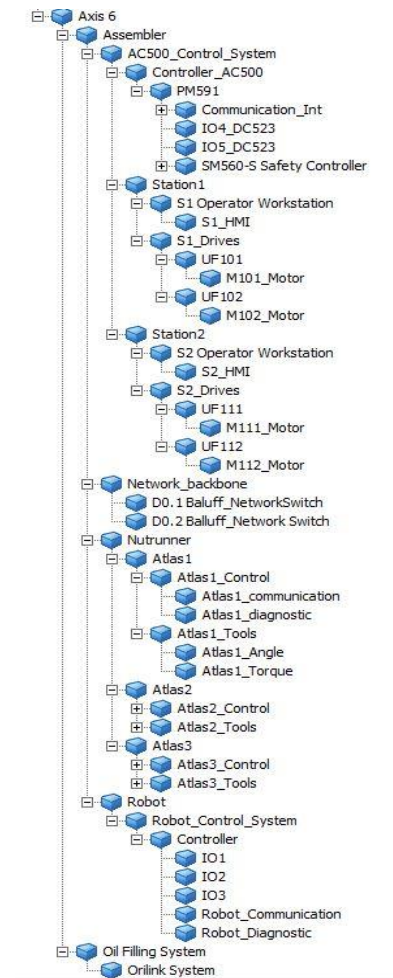

# Assembly requires system collaboration

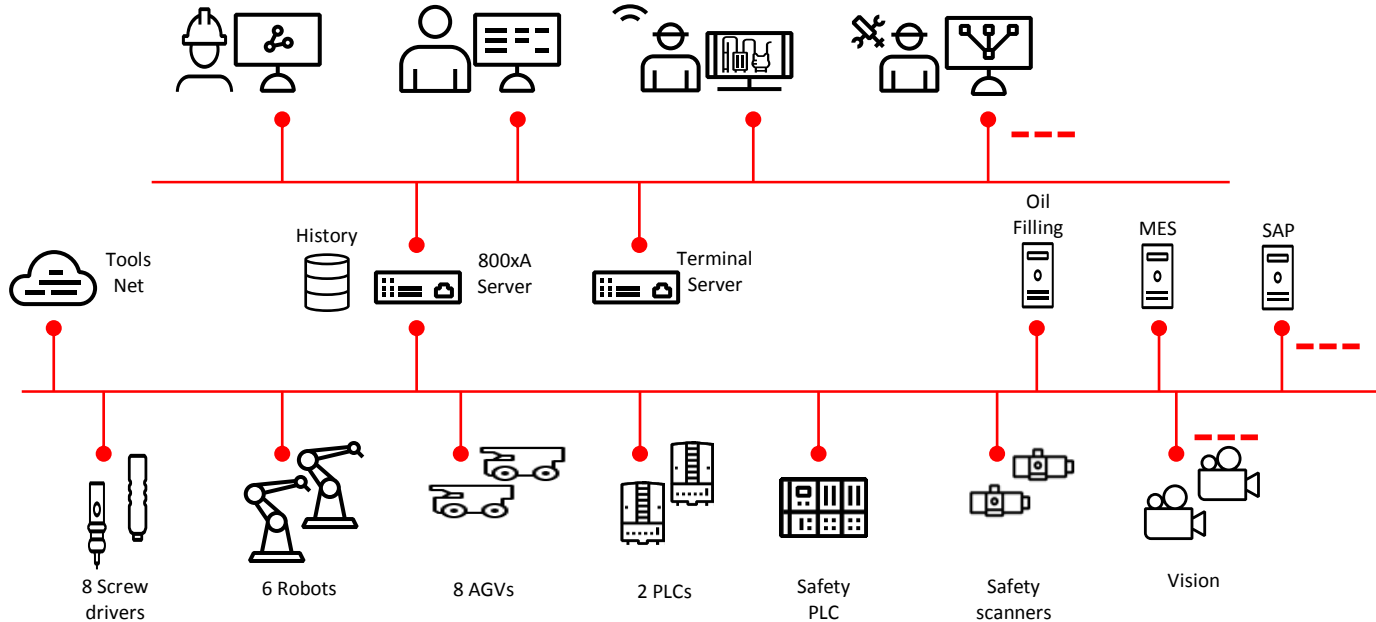

# PADME use case: System Integration

# Manufacturing line Digital Twin model

# PADME Systems Topology

# Collaboration values of PADME Solution

- Improvement areas
  - People – System
    - One environment with information from several systems
  - People – People
    - Visualization distributed to more persons
  - People – Equipment
    - More detailed information available through OPC-UA

# PADME partners

## Contributions per partner

### LEVEL21

Level21 contributes with expertise in discrete manufacturing and ensure that selected solutions are of business value.

### MDH

MDH will analyze digitalization maturity with respect to the possibility to build on CPAS logic in discrete manufacturing

### RISE-SICS

SICS is responsible for the optimization models aiming at minimizing the cycle time, and monitoring and controlling the workstations' operations to ensure consistent performance.

### ABB

ABB Process Industries is the main provider of technologies and expertise on IoT system architecture.

ABB Robotics provides the testbed as such and expertise in discrete manufacturing.
