

# KNX Building Automation

Global | Secure | Connected

[pierre.badenhorst@ie.abb.com](mailto:pierre.badenhorst@ie.abb.com)

# History

---

- KNX, also known as Konnex, is an open international building control standard.
- It is a successor of three previous standards, European Home Systems Protocol (EHS), BatiBUS and the European Installation Bus (EIB).
- The KNX standard is administered by the KNX Association, which was founded in 1990.
- Producer-specific systems brought little penetration to market, therefore KNX/EIB was developed.

Away from proprietary systems...

# Standards

KNX complies to:

- The International Standard ISO/IEC 14543-3-1 to 7
- The European Standard series EN-50090 (CENELEC)
- The European Standards EN13321-1 and EN1332-2 (CEN)
- Chinese Standard GB/T 20965
- US Standard ANSI/ASHRAE 135
- Australia and New Zealand SA/SNZ TS ISO/IEC 14543.3 (parts 1 to 6)

Building information modelling (BIM)

# Manufacturers

# The Logo

---

- Indication that product passed certification test
- Ensures the compatibility for all products, irrespective of function, brand or make
- Indicates the products compliance to relevant international standards

# Numbers

---

500

MANUFACTURERS IN 44  
COUNTRIES

Member companies that develop  
products, solutions and software

95,000

PARTNERS IN 190  
COUNTRIES

Contractors, building designers,  
installers, integrators who  
successfully completed a KNX  
basic course to become a  
certified KNX partner

500

KNX TRAINING CENTRES  
IN 68 COUNTRIES

Private and vocational training  
institutes who have been certified  
by KNX to conduct basic and  
advanced KNX courses

# Communication methods

## 4 methods of communication, either stand alone or combined

---

TP (Twisted pair)	Twisted pair cabling is considered to be the best data transfer medium for KNX as it offers free topology. It is a moderately low-cost and easy to install as the devices can be connected to each other without any hubs or switches.
PL (Powerline)	Powerline is typically used in renovation works when installing new cables are not practical. Powerline, as the name indicates, uses 230 V AC cables as a data transfer medium. The powerline devices need only the phase and the neutral conductors.
RF (Radio frequency)	Radio network is a suitable option when a wiring is not an option as a communication medium. With radio frequency, there is no hierarchical structure to follow as long as the sensors and coupling units are located within the radio signal range.
IP (Ethernet/Wi-Fi)	The benefits of Ethernet as a data transfer medium are the high bandwidth (100 Mbit/s) and cost-effective components. Ethernet can be used as a backbone for inter-system communication when the system is extensive, and twisted pair cabling can be used for local control.

---

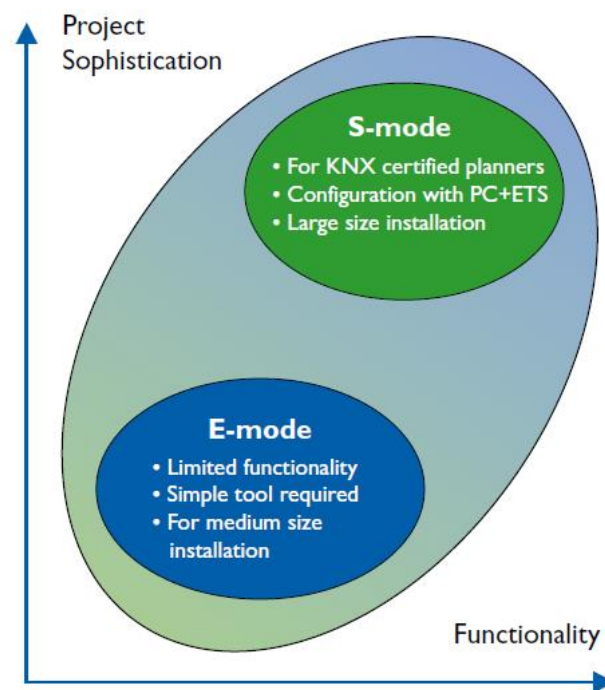

# Configuration modes

## S-mode (System Mode)

This configuration mechanism is intended for qualified KNX installers to realise sophisticated building control functions.

## E-mode (Easy Mode)

This configuration mechanism is meant for installers with basic KNX training. “E-mode” compatible products offer limited functions compared to S-Mode.

---

# System integration

---

## What is the role of the system integrator?

During system integration, all the requirements of the investor or building owner are implemented using KNX devices and the respective product software

### 1. Planning

During the planning process the preliminary requirements of the specification are incorporated into the concept and summarized in the functional description

### 2. Engineering

The most suitable components and software applications are selected. The planning of the bus topology is also realized during the engineering phase. The system devices required for implementing the KNX network are defined. The project engineering using ETS software also takes place in this phase

### 3. Commissioning

During the commissioning phase, the KNX devices are addressed and programmed. The ETS project that has already been created is downloaded into the devices using the ETS software

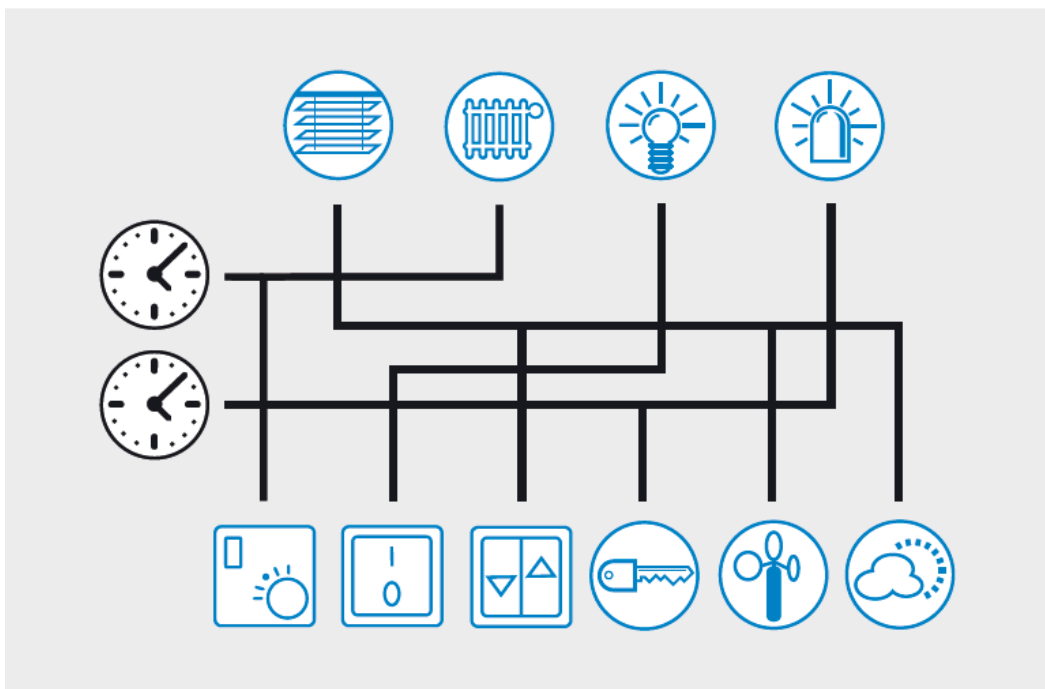

### 4. Handover

During the handover phase, the programmed functions are checked for compliance to the requirements in the functional description. In this way, the correct function of the installation can be determined and documented

### 5. Documentation

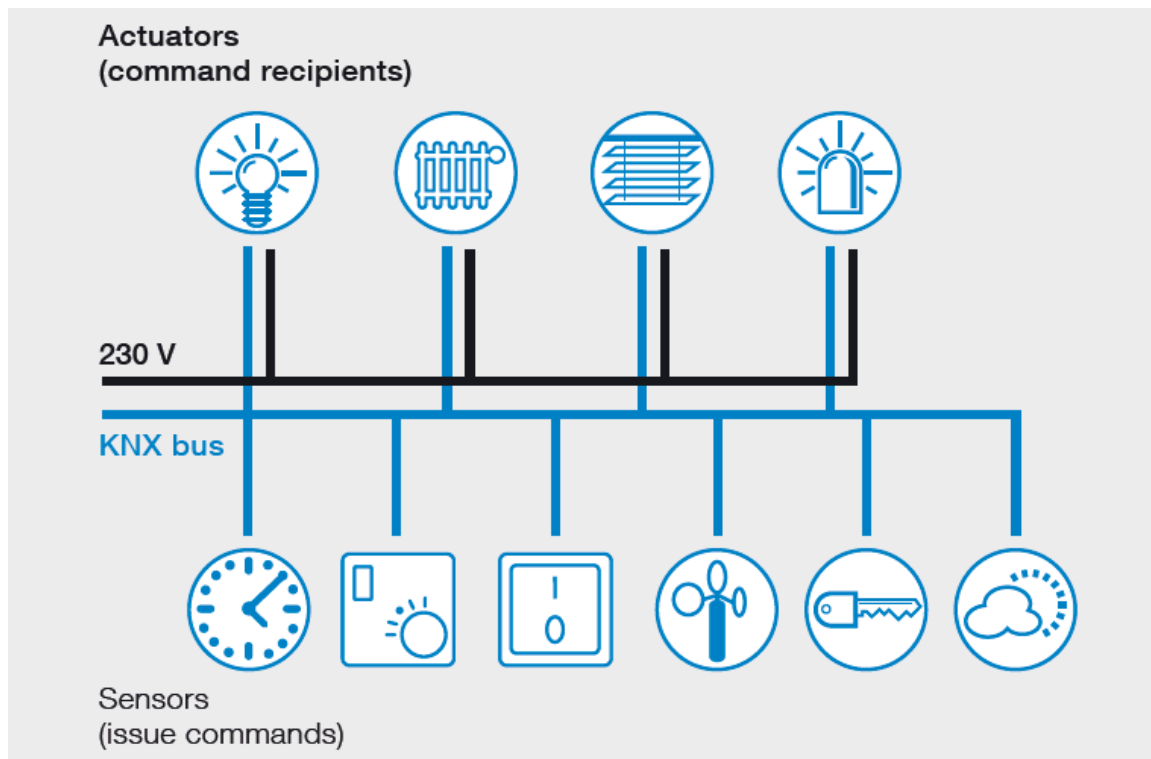

The customer receives the project documentation (schematics, function description and ETS project data) after the handover

# Conventional solution

- Many separate installations
- No compatibility
- Separate functionality
- Little to no flexibility

# Automated solution

- Flexible, future proof
- Systems approach
- Increased safety
- Convenience

---

# Benefits of a KNX designed installation

---

## Proven system

---

KNX was implemented over decades in various prestigious projects all around the world and is by now well known as a proven and trusted system

## Independency

---

Investors value KNX highly due to the fact that it makes them independent of individual manufacturers or proprietary systems

## Seamless solution

---

Creating outstanding working and living environments

Designed to embrace unique and individual corporate cultures and needs

## Diversity

---

Covers a diversity of applications using one standard

Integration of all building functions

## De-centralised system

---

There is no need for a central control unit

Each device holds its own device software and data

## Wiring

---

Cabling and networking is much simpler and more cost efficient

All devices on the same bus line

Independent from DALI bus

# Optimised energy savings

---

How do we maximise energy savings in a buildings?

- Energy is only consumed when it is actually needed  
(for example through the usage of presence detectors and schedules)
- Only the amount of energy actually required is used  
(for example through the use of constant lighting control and regulation)
- The energy used is employed at the highest possible degree of efficiency  
(for example through the use of energy efficient luminaires)

# Applications

# Internet of Things - IoT

# Input devices

Input devices send telegrams with orders:

- Switches
- Scene setting controllers
- Binary inputs
- Sensors
- Thermostats
- Weather stations

Various detection ranges

- Small offices
  - Open plan areas
  - Corridors
  - High bay installations
- 4 channels

Various detection ranges

- Small offices
- Open plan areas
- Corridors
- High bay installations

4 channels

Master and/or slave

Presence and absence control

Daylight monitoring

For switching, dimming or brightness control

HVAC functions

5 logic channels

Remote addressable

# Control elements

Freely configurable multifunction control element

- Toggle
- Switching
- Dimming
- Scene/value control
- Blocking function
- Group control
- Central control

Room temperature controller

- Integrated temperature sensor
- Actual value temperature display
- Display of set-value temperature
- Mode setting
- Fan coil control
- Integrated air quality sensors
  - CO<sub>2</sub> concentration
  - Humidity

# Output devices

Output devices are usually in the electrical panel and will carry out these orders:

- Switching
- Dimming
  - Mains dimming (LEDi)
  - DALI control
  - 1-10V control
  - RGBW control
- Blind control
- Heating control

# Switch actuators

## Functions:

- Switching
- Timed function
- Scene control
- Logic control
- Heating control

Each output has independent load current detection

- Load current detection (from 20 mA)
- Detection of failures
- Recording of actual operating hours

Available in 2, 4, 8, 12 and 24 channel devices

# DALI control

2 models, 1ch/64dev & 2ch/128dev  
 DALI power supply integrated

Functions:

- Switching
- Dimming
- Constant light control
- Scene control
- Timed functions
- Tuneable white
- Human centric lighting

# — DALI control

# DALI control

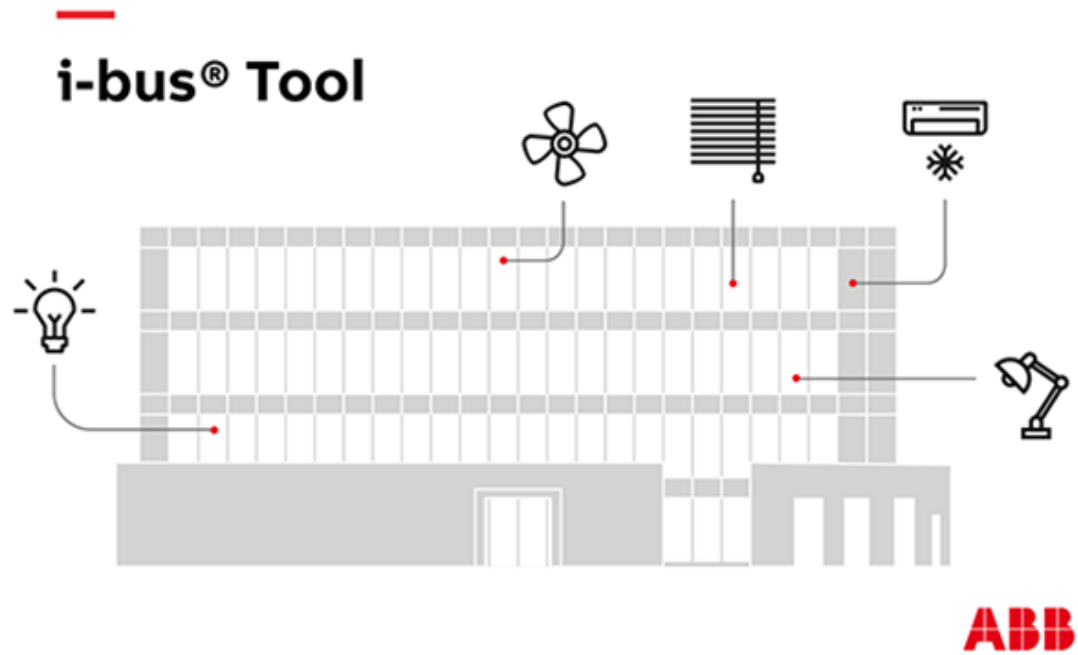

2 models, 1ch/64dev & 2ch/128dev  
 DALI power supply integrated

Functions:

- Switching
- Dimming
- Constant light control
- Scene control
- Timed functions
- Tuneable white
- Human centric lighting
- Emergency lighting
  - Status
  - Values
  - Errors
  - Faults
  - Reporting
  - Testing

<input type="button" value="Acknowledge all faults"/>	

# — DALI control - Broadcast

# Blind actuators

Blinds, curtains, shutters, windows, doors  
230V AC & 24V DC control

Contacts mechanically interlocked

Functions:

- Open/Close or Up/Down
  - Feedback
  - Scene control
  - Slat adjustment
  - Fault indication
  - Automated control with weather station
- SMI (Standard Motor Interface) devices available

# Air quality sensors

Control and measuring of the room air quality

Accurately measures:

- CO<sub>2</sub> concentration (390...10.000 ppm)
- Humidity (0...100 %)
- Temperature (0...50 °C)

Local indication

Fully configurable

# Interfaces and gateways

Interface/gateway protocols:

- KNX-USB
- KNX-IP
- KNX-M-Bus
- KNX-Modbus
- KNX-BACnet
- KNX-EnOcean
- KNX-RS232

# Visualisation

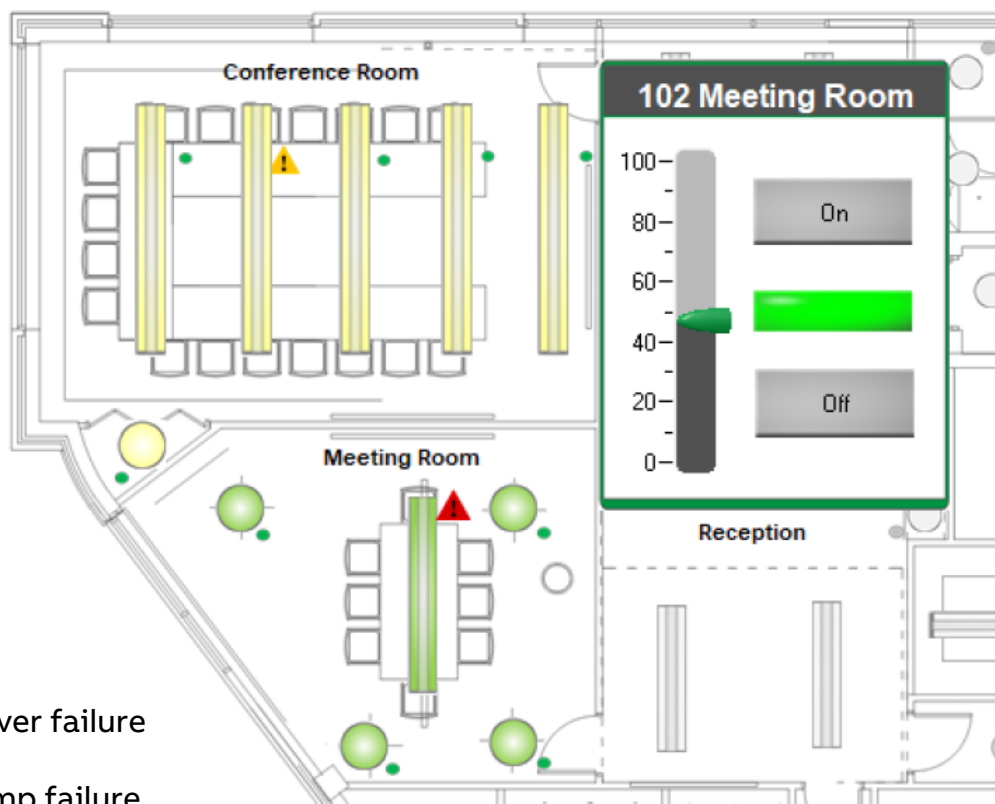

The screenshot displays the ABB IoT Dashboard for a "Training room 'Hertz'". The interface is organized into several control panels:

- Light strip window side:** Includes a light bulb icon and up/down arrows.
- Light strip middle:** Includes a light bulb icon and up/down arrows.
- Light strip wall side:** Includes a light bulb icon and up/down arrows.
- Light spot trainer:** Includes a light bulb icon and up/down arrows.
- Light wall:** Includes a light bulb icon and a horizontal slider.
- Remote Scene:** Includes buttons for "Start", "End", and "Break".
- Socket outlets - practical:** Includes a square icon.
- Socket outlets - theoretical:** Includes a square icon.
- Window:** Includes a window icon.
- Watersensor:** Displays "OK".
- Blinds:** Shows a diagram of a window with "Shutter position" at 23% and "Slat position" at 17%.
- Room temperature controller:** Shows a power button icon, a leaf icon, a person icon, and a temperature reading of **24,1°C**.
- Light strip:** Includes a color wheel, a light bulb icon, and a horizontal slider set to 100%.
- CO2:** Shows a gauge with a reading of **904ppm**.

# Heating control

# Climate control (HVAC)

# KNX topology

Based on the principle of separation of energy and information.

# KNX bus cable

All KNX devices are connected in parallel with a bus line.

The bus line provides power and enables the flow of data.

It is recommended to use a KNX-certified bus line. In addition to the requisite physical properties (number of cores, cross-section, isolation voltage, etc.), the bus line can be immediately distinguished from other weak-current lines.

# KNX bus cable

YCYM 2x2x0.8

Fixed installation

- Dry, humid and wet rooms
  - Wall mounted
  - Flush mounted
  - In conduits
- Outdoor  
(if protected against direct sun radiation)

Test voltage: 4kV according to EN 50090

J-Y (St) Y 2x2x0.8 VDE 0815

Fixed installation

- Dry, humid industrial sites
  - Wall mounted
  - Flush mounted
  - In conduits
- Outdoor
  - Flush mounted
  - In conduits

Test voltage: 2,5kV according to EN 50090

# KNX bus cabling rules

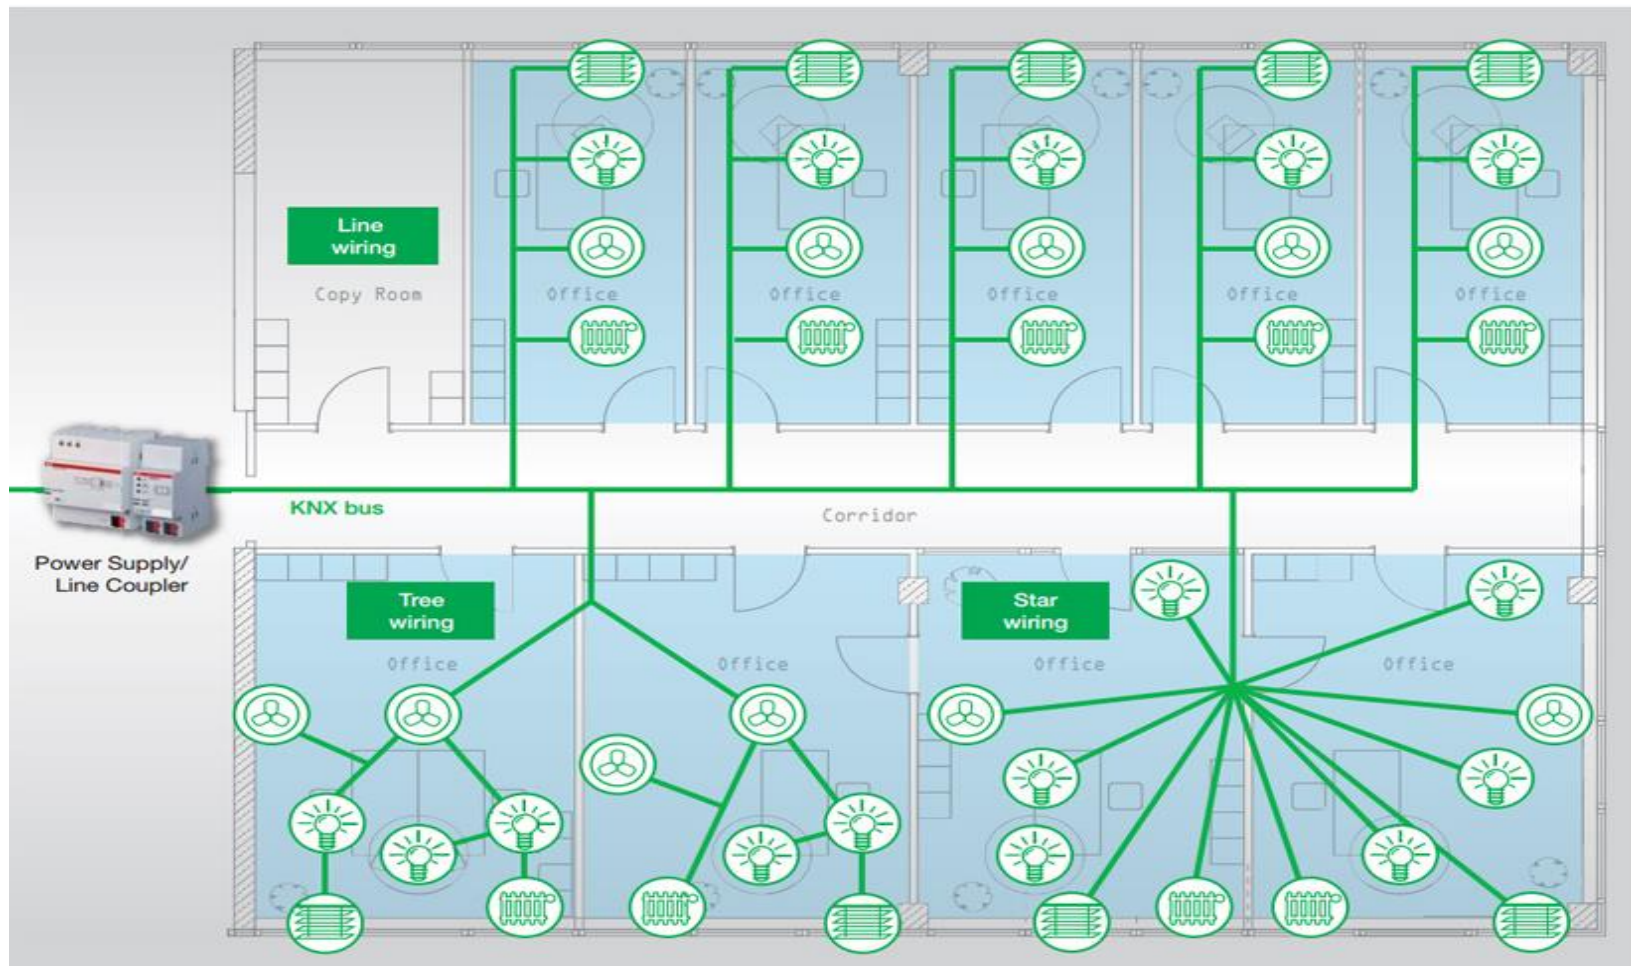

Isolated single core 230V adjacent to the sheath of the bus cable

Adjacency of individual wires

# KNX bus cabling rules

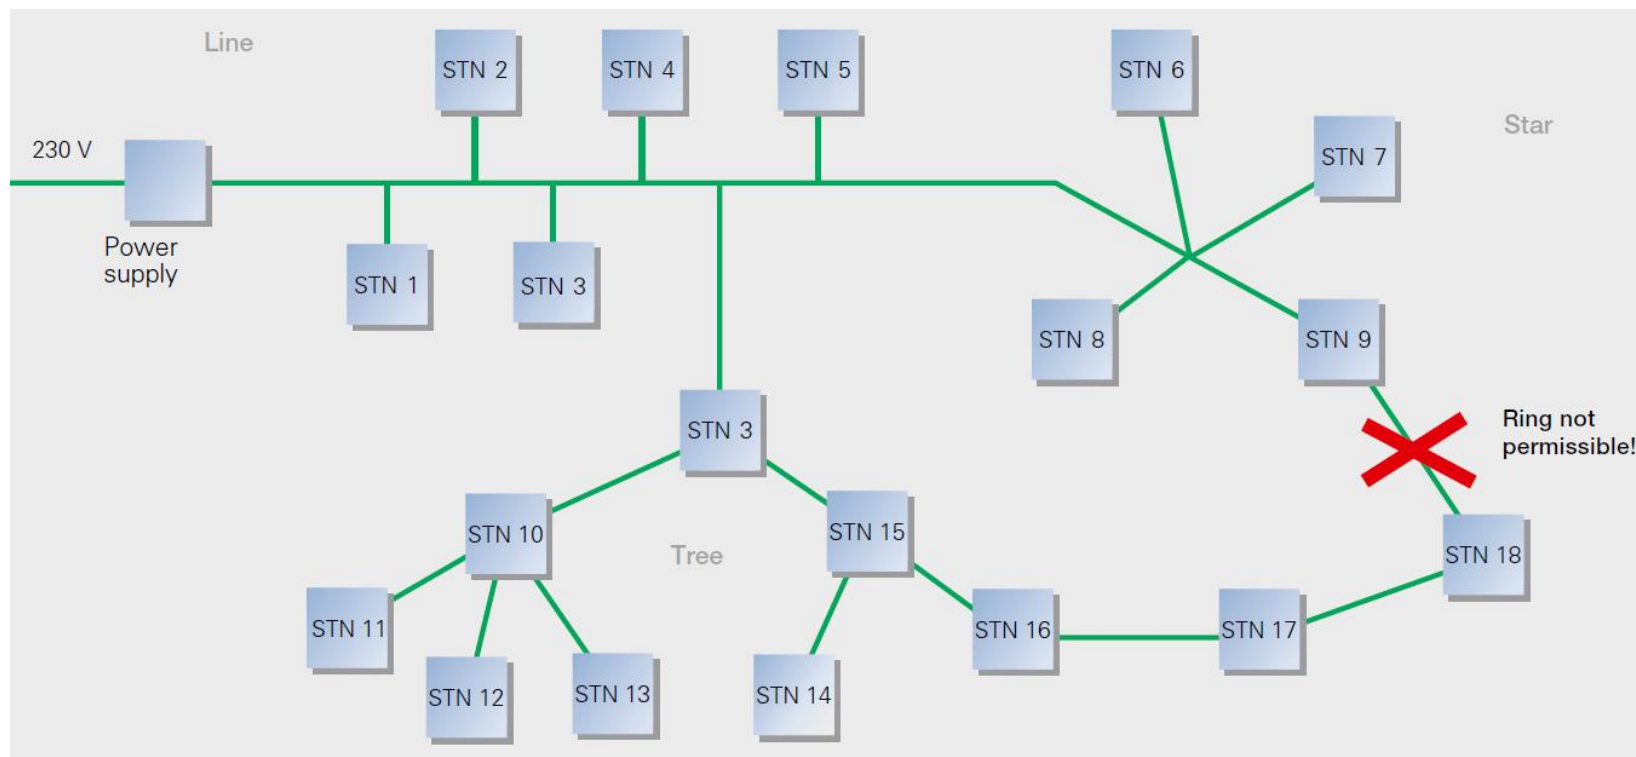

# KNX bus cabling rules

# KNX bus cabling rules

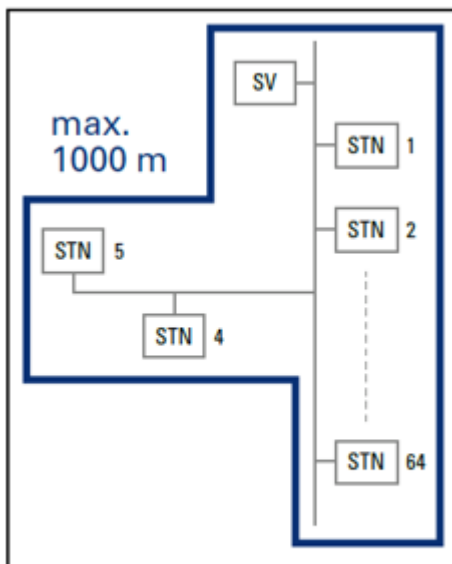

It is important to respect the KNX rules when connecting different lines or segments!

# Topology – Cable distances

## Line topology

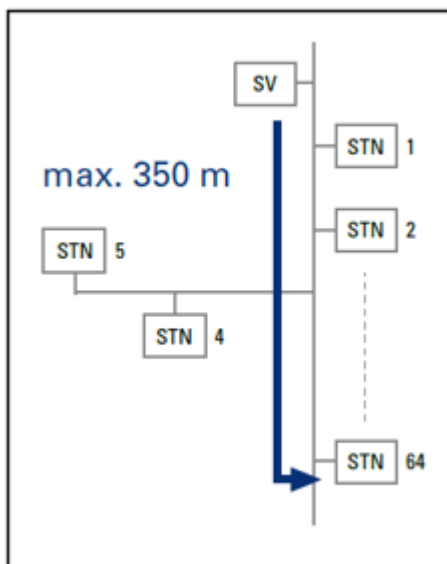

The wire lengths within a line are limited. Total length maximum 1000m

SV = Power supply  
STN = Station

## Maximum distance

Between power supply and last device:  
maximum 350m

## Maximum distance

Between 2 devices:  
maximum 700m

## Minimum distance

Between 2 power supplies:  
minimum 200m

# Topology - Lines

Each line can accommodate up to 64 devices. If there are more than 64 devices, or several parts of the building are involved, it might be necessary to create more lines in an area.

This is done by utilizing line couplers. The different lines are all connected to a main line, and this line, which only has a power supply, forms the backbone of the line couplers.

A line can also be extended by using a line coupler as a line repeater. Up to 3 can be added to a line, increasing the amount of devices to 256!

# Topology - Areas

The line limit per area are 15 lines.  
This can be overcome by creating additional areas, with the limit also being 15.

Area couplers are used to connect the different areas.

And furthermore, suitable interfaces will allow KNX to be connected to other systems of the building systems automation.

---

## Conclusion

---

### Energy Savings with KNX:

- Up to 40% with KNX shading control
- Up to 50% with KNX individual room control
- Up to 60% with KNX lighting control
- Up to 60% with KNX ventilation control
